

F7 — Weather-record integrity: a record can pass every conventional check and still invert a correction

The superseded Melbourne Regional Office file has the correct row count (8,760), no missing-value sentinels, and a plausible annual mean wind speed (2.71 m/s). Four calendar months of its wind column nevertheless read identically 0.0 m/s — an artefact of the station's record ending in 2014 — which is enough to flip the sign of the C2 correction.

A — Monthly mean wind speed, the two station records

B — The same correction, on the two records
