

# F9 — Closure residual and inventory completeness

The instrument is identical across states by construction — the closure commits are cherry-picked onto each one — which is what makes the states comparable.  
Sources: results/paper/trajectory\_v2/ (residual, line-item count, re-integration); the pre-closure count of 2 is from results/au\_corrections\_closed/six\_state\_closed.md.

**A — V2 closure residual, all thirteen states, against the  $\pm 5\%$  gate**

**B — Transmission inventory completeness: seven surfaces, seven line items**
