

F8 — The latent gate: latent cooling is charged only in hours the cooling plant actually runs

Source: results/paper/trajectory_v2/trajectory_raw.json (per-state config_B) and comparison.md §6. The ungated column is the zone moisture balance before the plant-on gate; it is a diagnostic contrast only and is never part of a total.

1 — Gated latent cooling against the ungated zone moisture balance, all thirteen states

2 — Monthly gated latent cooling at the canonical state: the austral-summer phase

3 — The gating audit: latent charged with the plant off, and while heating
