

F5 — Corrected-state annual energy balance, canonical model (+Closure fixes)

Same building, same weather, same conventions and same vertical scale as F2 · all seven transmission line items resolved
Inputs 3,822.5 kWh · outputs 3,822.5 kWh · residual 0.000e+00 kWh (0.00e+00 % of inputs) — the balance closes to machine precision

The balance closes

Inputs and outputs agree to 0.0e+00 kWh — machine zero. There is no gap to draw, and no residual re-published as a flow. Compare F2, where 96.7 kWh had no source.

The five party surfaces are now inventoried

1,016 kWh, 26.6 % of output, on both sides of the balance. In F2 the same five carried 4,865 kWh against an open residual; here they are resolved and the balance answers for them.

Read F2 and F5 together

The whole balance is 3,822 kWh here against 8,306 kWh in F2, drawn at the same kWh per unit height. The columns are shorter because the model moved, not the drawing.
